

# ZOMATO SALES & CUSTOMER INSIGHTS REPORT

**Sprint 7 – Final Project**  
**Prepared by: Nana-Serwaah Nyannor**

## Executive Summary

This report analyzes Zomato’s sales performance, customer behavior, and restaurant trends using three years of order data. Across 150K orders placed by 78K customers, total revenue reached approximately ₹987M. Revenue shows strong seasonality, with dips during mid-year and recovery toward November–December. High-performing cuisines such as North Indian, Indian, and Chinese dominate total revenue and customer preference. A key data quality issue is the presence of a large “Blank” restaurant category caused by missing restaurant IDs, which impacts the accuracy of restaurant-level insights.

## Data Quality Notes

- Many orders contain missing restaurant IDs, resulting in a high-revenue “Blank” restaurant category.
- Several cuisines appear with inconsistent naming or duplicates (e.g., multiple versions of North Indian).
- These issues distort rankings and limit the reliability of restaurant-level analysis.

## KPI Overview

- **Total Revenue:** 987M
- **Total Orders:** 150K
- **Total Customers:** 78K
- **Average Revenue per Customer:** 6.56K

These KPIs give a high-level view of Zomato’s operational scale and customer spending behavior.

| Average Revenue | Total Orders | Total Revenue | Total Customers |
|-----------------|--------------|---------------|-----------------|
| 6.56K           | 150K         | 987M          | 78K             |

## Visual Insights

### 1. Revenue Trend Over Time

The line chart shows revenue increasing significantly between 2017 and 2018 before steadily declining through 2019 and 2020. This suggests a downturn in business performance over time or a reduction in available data in later years.

## 2. Top Restaurants by Revenue

One large outlier (“Blank”) appears due to missing restaurant IDs. Once removed, verified restaurants such as Domino’s Pizza perform consistently but at much lower levels.

## 3. Top Cuisines by Revenue

North Indian, Indian, and Chinese dominate total revenue, reinforcing strong customer preference for these cuisine types.

## 4. Pie Chart – Orders by Cuisine

Order distribution mirrors revenue patterns: major cuisines generate the majority of orders, while smaller categories appear in much smaller proportions.

### 5. Scatter Plot – Revenue vs Orders

Most restaurants cluster at low-order, low-revenue levels, while a few outliers stand out. The extreme outlier corresponds to the unmapped “Blank” restaurant, further highlighting the data quality issue.

### Recommendations

- Fix missing restaurant IDs to eliminate the “Blank” outlier and improve restaurant-level accuracy.
- Standardize cuisine labels to ensure consistent grouping and eliminate duplicates.
- Leverage top cuisine performance (North Indian, Indian, Chinese) for targeted promotions.
- Investigate mid-year revenue dips to identify operational or seasonal factors influencing demand.
- Continue monitoring scatter plot outliers to identify restaurants with unusual performance.

### Conclusion

This analysis highlights Zomato’s strong revenue drivers, key cuisine preferences, and clear seasonal demand patterns. While performance insights are valuable, data quality limitations—especially missing restaurant IDs—hinder complete visibility. Improving data consistency will significantly enhance Zomato’s ability to make strategic, data-driven decisions going forward.
